Nearly **1 in 3 adults** isn't up to date on the cancer screenings and vaccines they need.

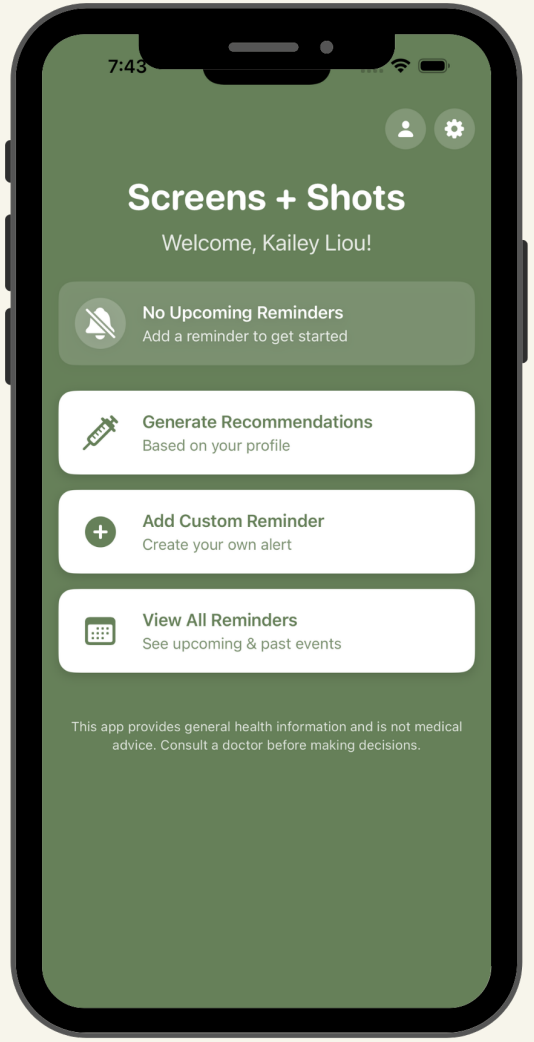

Screens + Shots

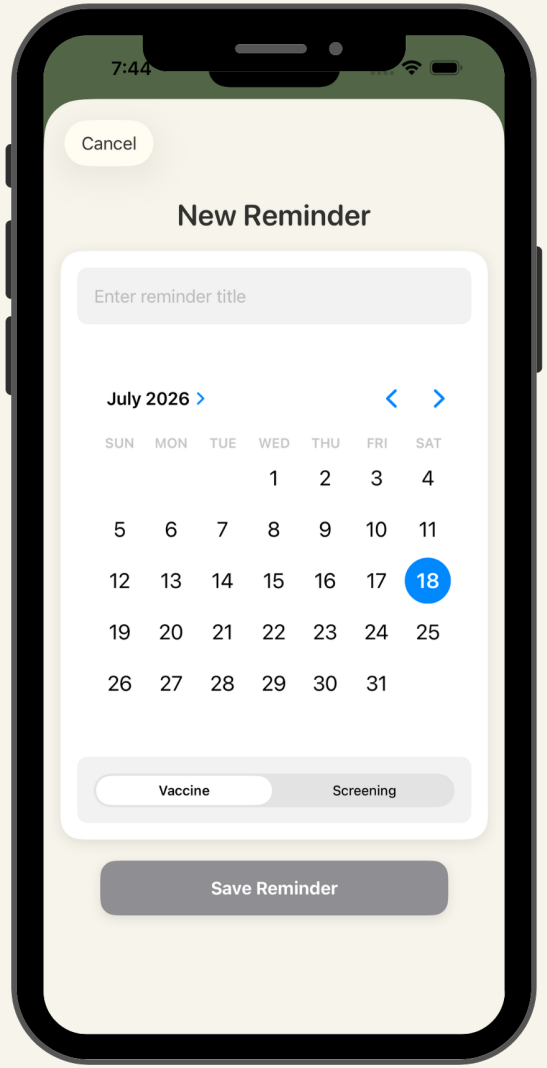

THE PROBLEM

- January 2023: my uncle passed away after a 3-year battle with colorectal cancer
- Diagnosed at 50, but ACS lowered the recommended screening age to 45 back in 2018
- USPSTF didn't finalize that update until 2021, too late for his diagnosis
- By diagnosis, his cancer was already stage 3, and soon progressed to stage 4

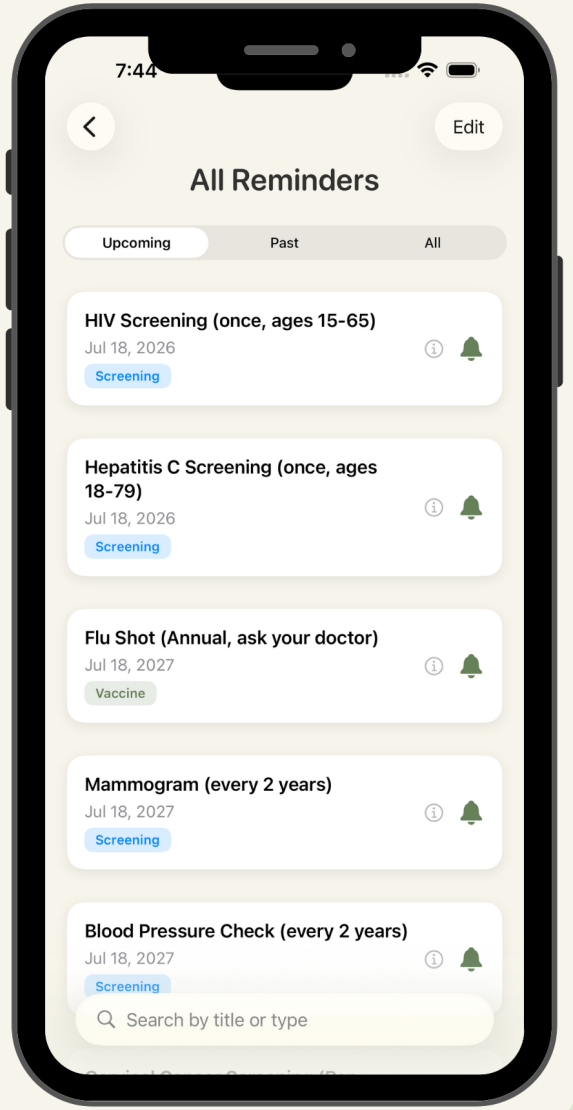

WHY IT MATTERS

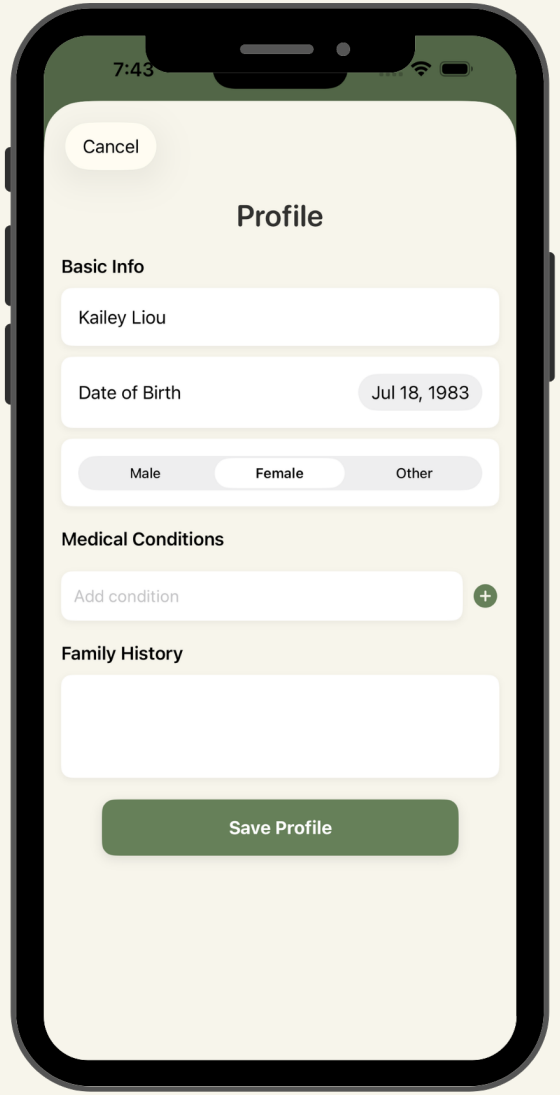

- Accessibility isn't only about disability, it’s about who gets to access information, spaces, and resources
- Most people don't know when they're due for a screening or vaccine, or where to find a reliable answer
- Screens + Shots closes that information gap for both kids and adults, in one place

WHO BENEFITS

- Adults who don't have a running list of what's due, and when
- Parents tracking childhood vaccine schedules for their kids
- Anyone who wants to walk into an appointment already informed

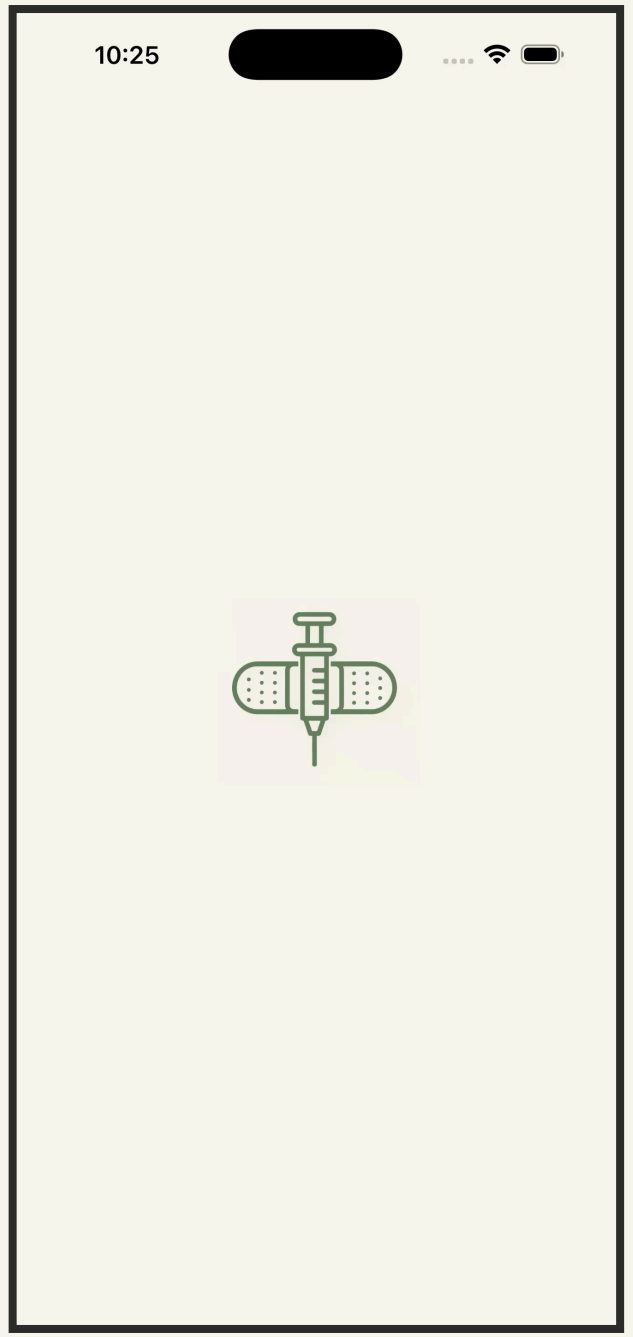

SOLUTION + KEY FEATURES

- Personalized recommendations from age, gender, date of birth, conditions, and family history
- Explanations: tap any reminder to see why it matters, in plain language
- Full reminder management: add, edit, or multi-select delete
- Configurable notifications, and a dashboard highlighting what's next

HOW IT WORKS

Screens + Shots

COMPETITION

- **WebMD:** general health info, but not personalized or reminder-based
- **MyChart (Epic):** tied to a specific health system, not preventive tracking
- **Apple Health:** logs data, but doesn't explain what's due or why
- **Screens + Shots:** personalized, explains its reasoning, works for the whole family

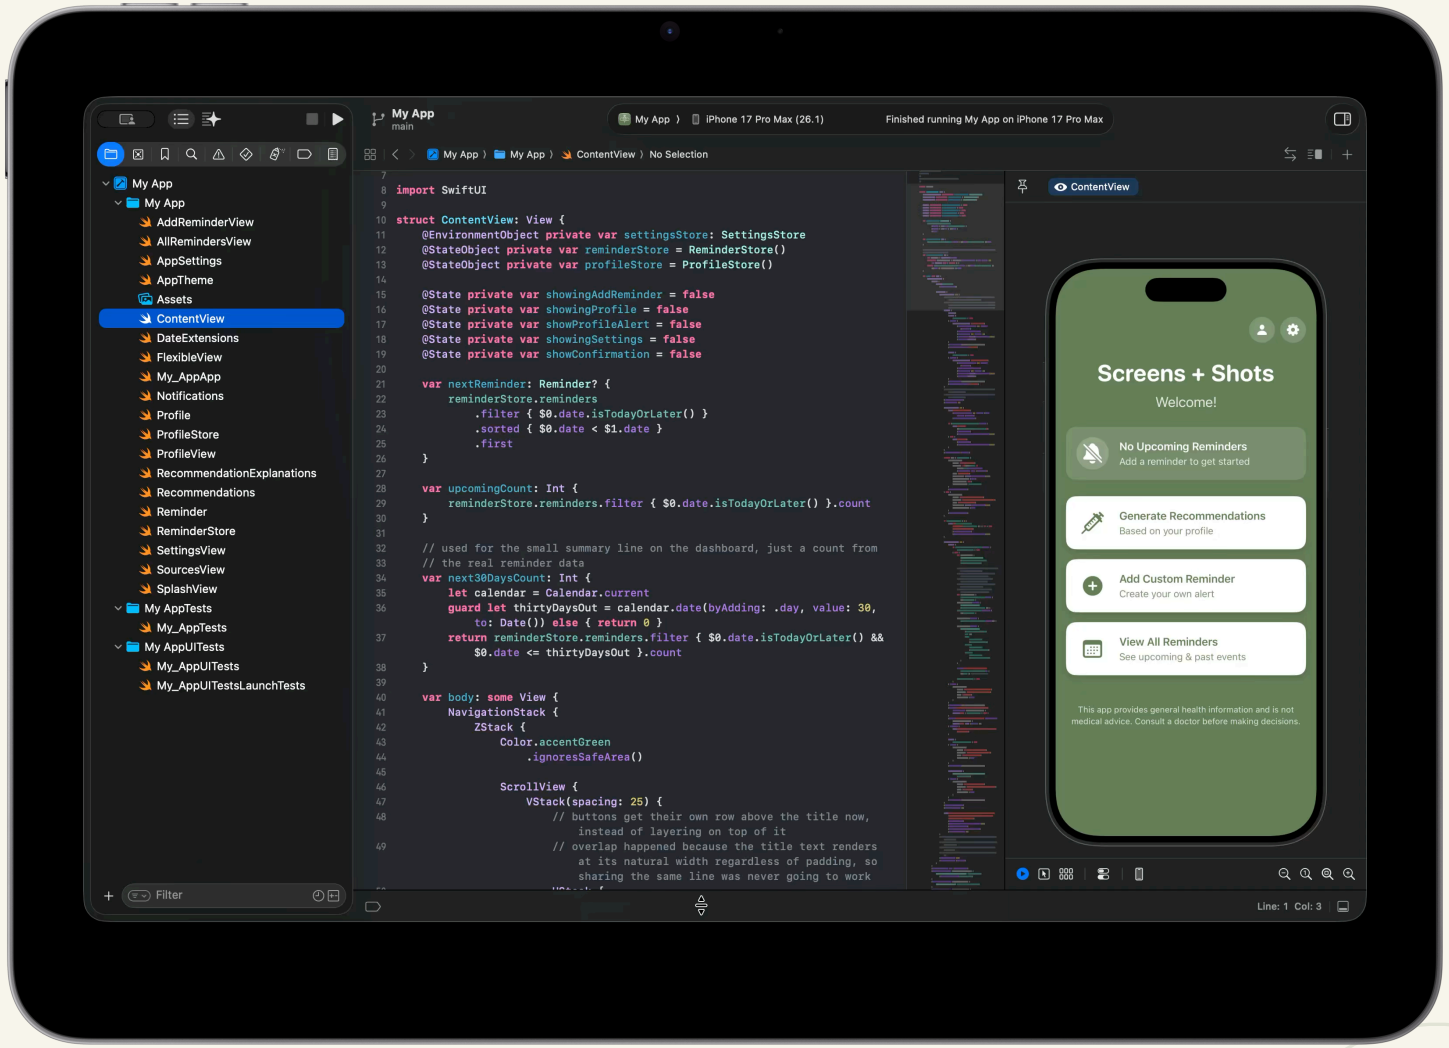

WebMD®

MyChart

CODE SPOTLIGHT

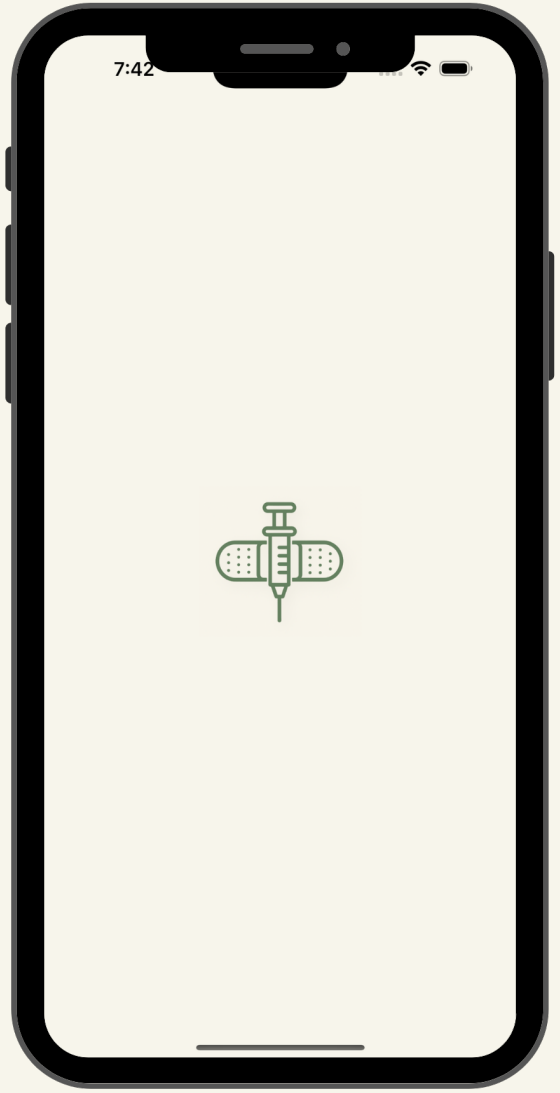

RECOMMENDATIONS.SWIFT

- Hardcoded against real CDC/ USPSTF guidelines
- Recurring reminders calculate their real next future date instead of defaulting to today
- Layers in conditions automatically (a diabetes tag adds an annual eye exam on its own)
- Organized into clean Store objects, commented throughout

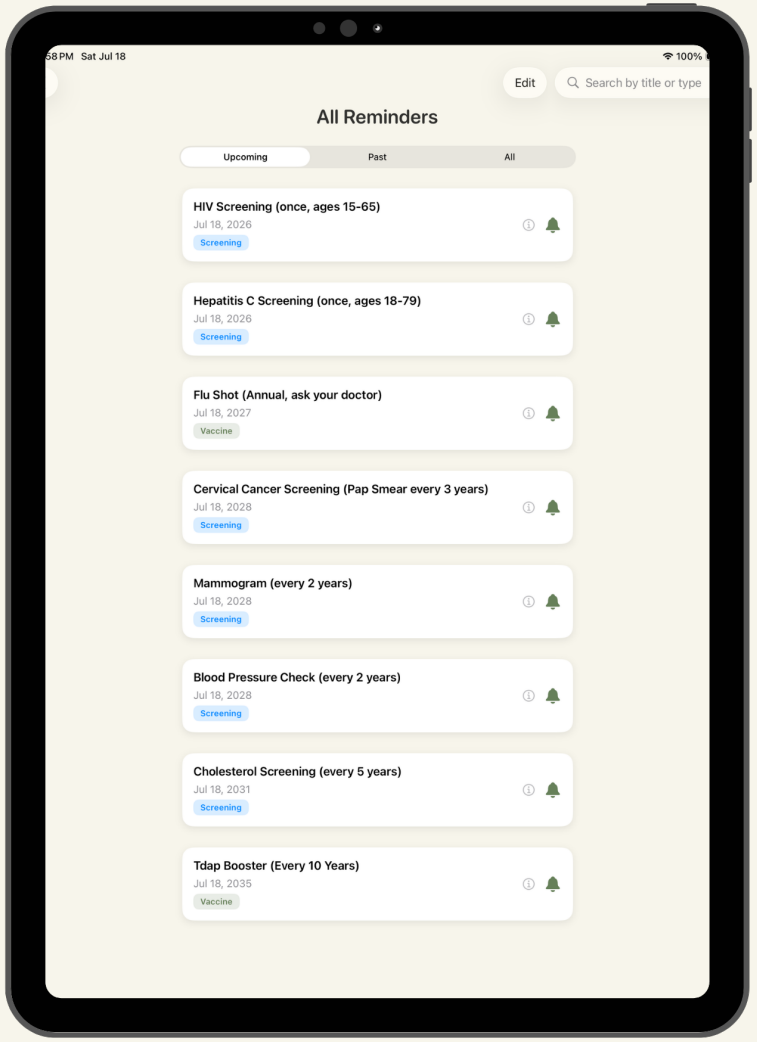

ACCESSIBILITY & DESIGN

- SwiftUI's native components support VoiceOver and Dynamic Type by default
- Added explicit VoiceOver labels to icon-only buttons with no visible text
- High-contrast colors, large tap targets, uncluttered layout

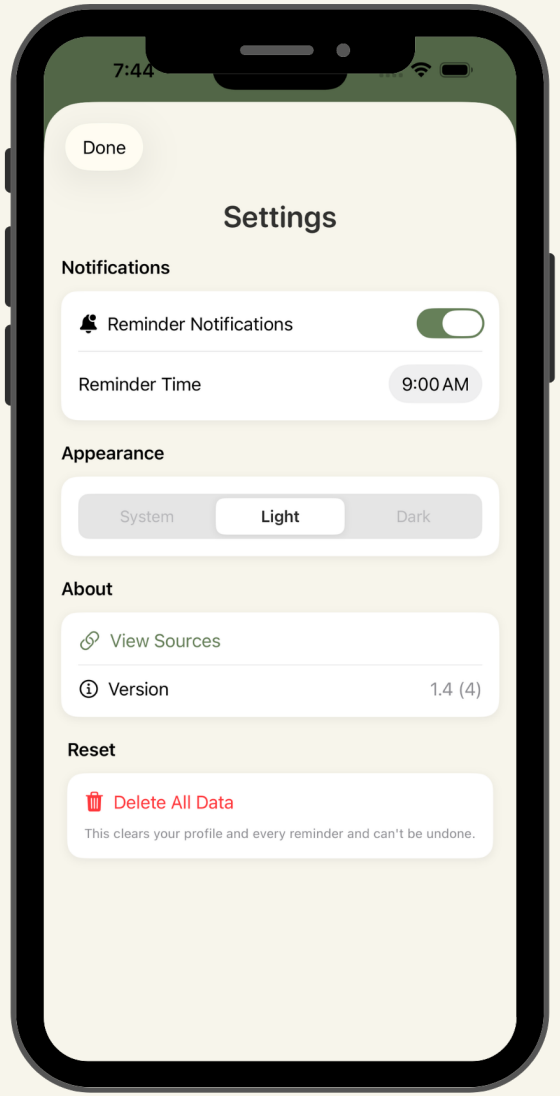

USER INTERFACE & INTERACTION

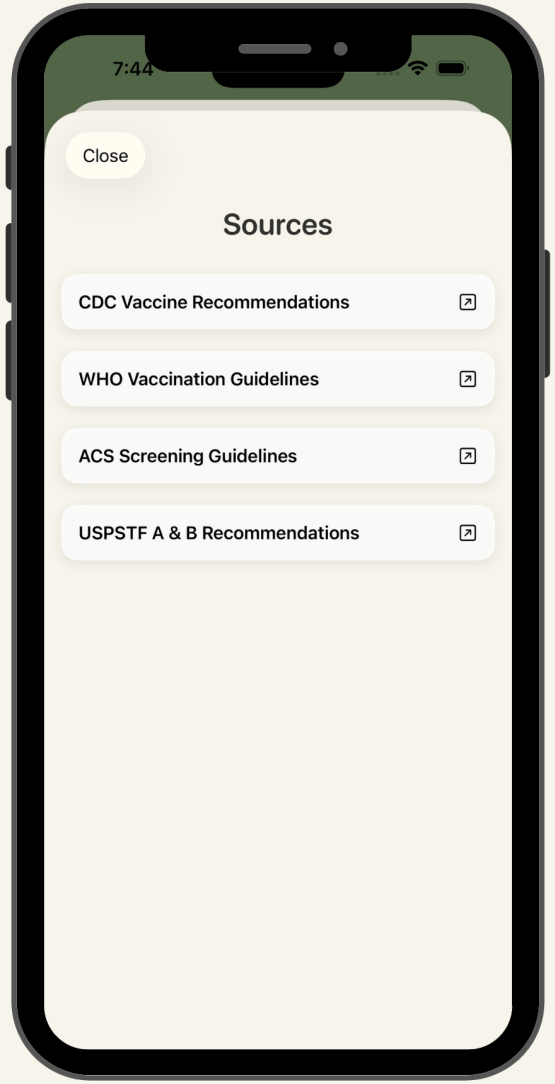

- Consistent design across every screen
- Real press animations, so the interface feels responsive
- Clear navigation helps users know where they are
- Adapted for iPad (layouts stay a comfortable width)

TECHNICAL CHALLENGES

- Fixing how the "next reminder" was being filtered and compared
- A swipe-delete bug that removed the wrong item (fixed by matching real objects, not list position)
- Preventing duplicate reminders when recommendations regenerate
- Getting iPad's sheet to use the full screen instead of a clipped panel

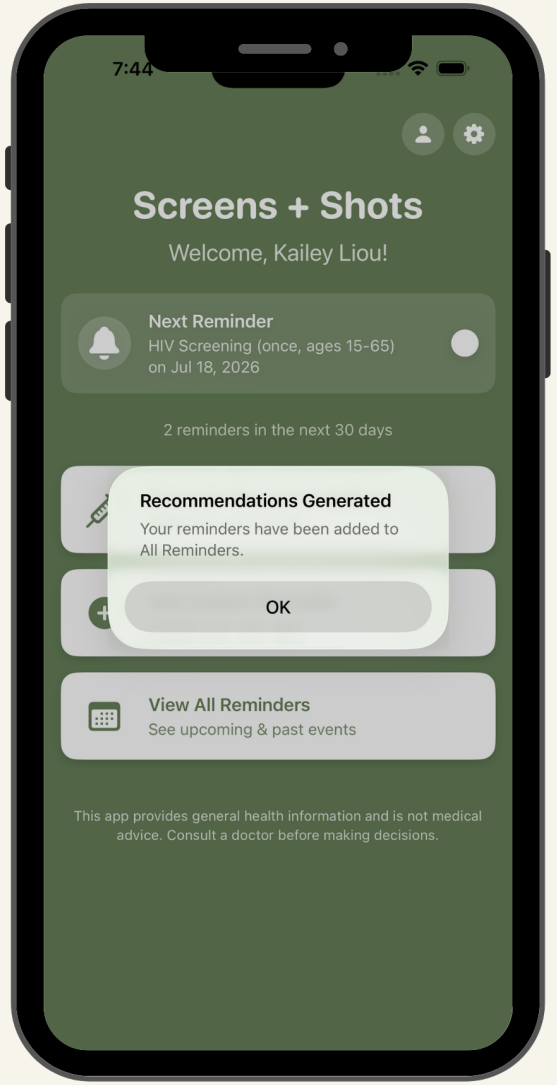

ETHICS

- Every recommendation traces to a trusted source (CDC, USPSTF)
- Clear disclaimer (general guidance only, not medical advice)
- All data stored locally on-device, never uploaded
- Minimal data collection (only what's actually needed)

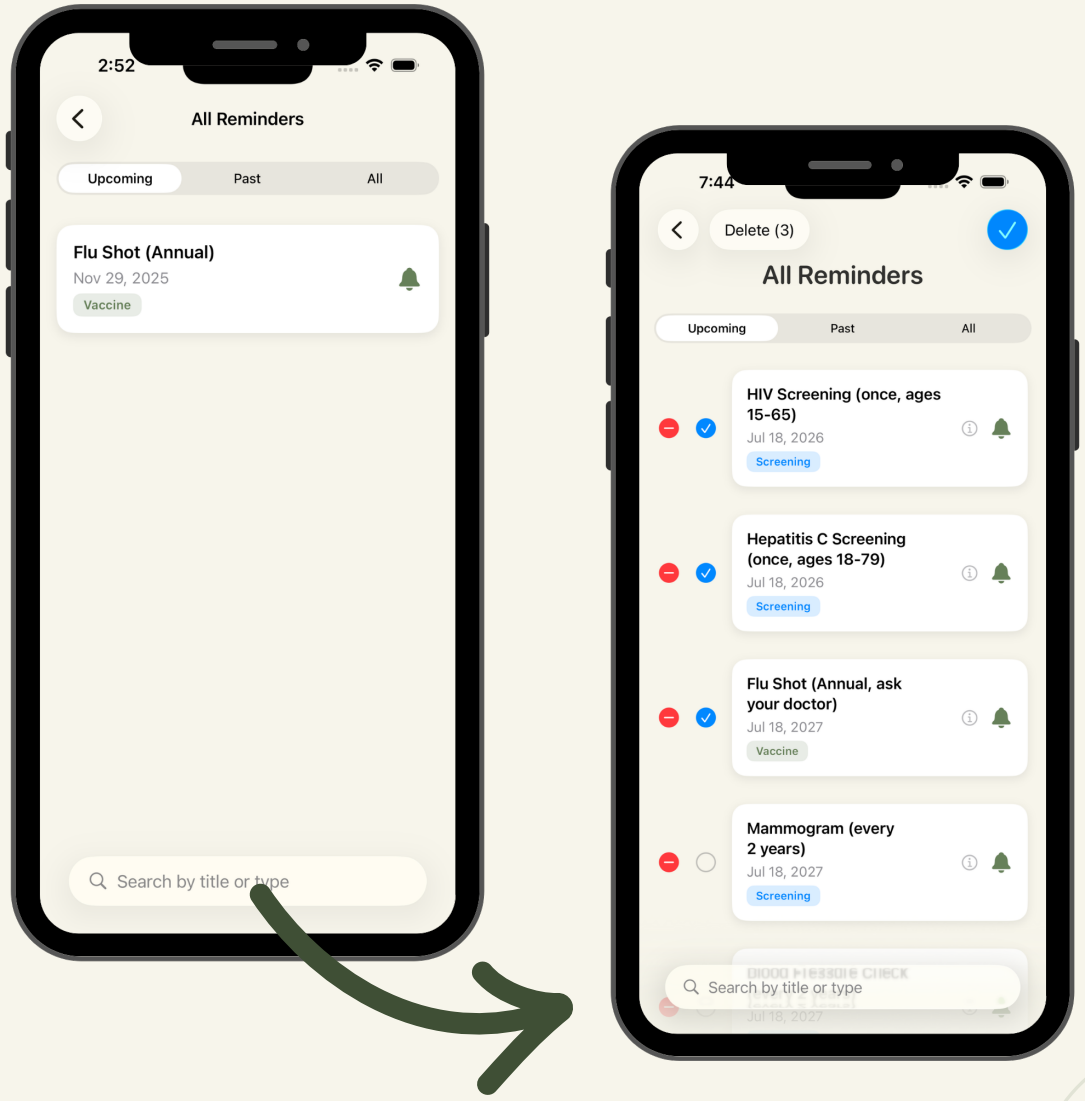

LEVERAGING AI

- Used Claude for debugging, implementing complex features, and auditing my logic
- Every product decision and all testing were mine
- Chose not to use live AI for recommendations (reliability over novelty)

THE JOURNEY

- Published an early version months ago (broken notifications, recommendations off)
- Spent weeks rebuilding the logic and fixing the UI
- Added a settings page
- Ability to edit reminders and select delete
- Added an info icon to reminders

DESIGN PROCESS

- Sage green + cream
- Rounded, friendly fonts
- Icon redesigned in Icon Composer for the liquid glass style
- Name is literal on purpose: screenings and shots

Shots & Screens

WHAT'S NEXT

- Mark-as-Done, tied to the recurring schedule
- Family member profiles, so parents can track their kids too
- Full dark mode, and closing the Dynamic Type gap
- Direct links to CDC, AAP, USPSTF, and ACS guidelines
- Optional Face ID lock for sensitive health data

Thank you!
